Backend Systems Architecture & Production Engineering – High-Scale Platforms & Tooling

Backend Engineering Excellence | Platform Stability & Operations | Automation & Workflow Optimization | Data Quality & System Integrity

- **Backend Systems Architecture:** Designed robust, modular, and scalable Python/Django backend platforms that supported growing product workloads and evolving organisational needs.
- **Enterprise Engineering Operations:** Delivered stable, high-performance production ecosystems by refining operational workflows, improving responsiveness, and supporting complex multi-application environments.
- **Automation & Platform Efficiency:** Created reusable automation components and structured operational frameworks that reduced manual intervention, improved delivery speed, and strengthened execution consistency.
- **Technical Collaboration & Delivery Alignment:** Worked across engineering, release, operations, and leadership teams to ensure technical outputs aligned with compliance requirements, business priorities, and delivery expectations.

Career Overview

10/2021 – Present | Bangalore, Karnataka
Juniper Networks (erstwhile. HPE)
Software Engineer 3 | 07/2023 – Present
Software Engineer 2 | 10/2021 – 06/2023

07/2017 – 10/2021 | Bangalore, Karnataka
CGI
Software Engineer | 10/2019 – 10/2021
Associate Software Engineer | 07/2017 – 10/2019

Engineering Transformation & Process Reinvention

Production Stability & Platform Reliability

- Elevated internal systems from "keep-the-lights-on" support assets to dependable service backbones by consistently aligning design choices with resilience, graceful degradation, and predictable recovery paths for customer-facing workloads.
- Shifted the operating model from reactive firefighting to disciplined, pattern-aware reliability management, ensuring that incident learnings translated into durable safeguards rather than temporary fixes.

Automation Architecture & Operational Acceleration

- Reimagined routine operational tasks as automation candidates, turning fragmented manual runbooks into reusable engines that compressed execution time, reduced fatigue, and freed engineers to focus on higher-order problem solving.
- Created a repeatable blueprint for onboarding new applications into automation, allowing future teams to extend coverage with minimal friction while preserving control, traceability, and consistency.

Data Assurance & Information Reliability

- Transformed previously unreliable, partial datasets into trusted decision-support assets by treating data correctness as an engineering responsibility, not a downstream reporting problem.
- Embedded validation and repair thinking into core workflows so that every new feature or integration strengthened, rather than diluted, the overall quality and dependability of release and operational data.

Cross-Functional Collaboration & Technical Governance

- Used technical credibility and domain understanding to bring developers, operations, release managers, and leadership onto a common view of risk, impact, and priorities, enabling faster consensus on complex production decisions.
- Helped move the organisation towards a governance-driven culture by normalising documentation, access discipline, audit trails, and structured reviews as non-negotiable parts of how platforms are built and operated.

Work History

Juniper Networks (HPE) | Bangalore, Karnataka | 2021 - till date

Role: Software Engineer 2 | 11 Oct 2021 – June 2023
Role: Software Engineer 3 | July 2023 – Present

IMPACT: Built and scaled internal release-engineering platforms that strengthened operational reliability, eliminated manual dependencies, and delivered governed, audit-ready workflows for high-volume build environments. Elevated engineering maturity by embedding data completeness, traceability, and automation into systems supporting thousands of builds and daily user interactions across global teams. Enabled measurable improvements in release consistency, decision accuracy, and cross-functional productivity through stable architectures, secure integrations, and repeatable processes.

- **Release Engineering Platforms & Workflow Modernisation** - Developed and expanded a multi-module ecosystem consolidating build histories, PR mappings, and branch metadata—replacing fragmented email-based requests with a structured self-service model widely adopted across internal teams.
- **Complex Systems Integration Across Source, Build & Storage Layers -** Unified data from Git/SVN logs, Jenkins pipelines, MySQL repositories, and NFS metadata to provide reliable lineage visibility for release managers, developers, and QA teams.
- **Automation of Mission-Critical Operational Requests -** Built workflow logic automating 20–25 frequent release actions per week and managing 4,000+ tickets annually, reducing manual workload equivalent to 1–2 junior engineering roles.

- **Data Reliability, Integrity & Governance Reinforcement -** Implemented SQL-based validation frameworks and Python repair utilities to correct tens of thousands of legacy data gaps, establishing a trusted dataset for dashboards, APIs, and automation tools.
- **Build Failure Intelligence & Operational Risk Reduction -** Delivered a structured Build Failure Analysis platform categorising 30+ recurring failure types and tracking multi-run patterns—bringing monthly failures down from 40–60 to under 20 over two years.
- **Scalable Backend Architecture & Secure Access Controls:** - Designed a normalised MySQL schema (~12 tables) and integrated SSO/SAML authentication, SSL hardening, and role-based permissions aligned with ISO 27001 audit expectations.
- **High-Availability Infrastructure Stewardship -** Maintained DEV and PROD environments with full parity, executed quarterly OS patching, and completed an Ubuntu→RHEL migration with <15 minutes downtime while ensuring uninterrupted support for release-critical workflows.
- **API Ecosystem for Cross-Team Automation -** Built secure REST APIs enabling external systems to fetch PR data, trigger release workflows, and perform ticket transitions—expanding automation across Release, DevOps, and platform teams.
- **Progressive Evolution Across Multiple Versions -** Delivered eight major enhancements introducing repository expansion, build-duration analytics, retry logic, audit trails, and deeper system integrations over an 18-month development cycle.
- **Cross-Functional Collaboration & Knowledge Enablement -** Worked closely with infrastructure, network, QA, and release engineering teams to address systemic issues and improve workflow efficiency; mentored peers in Django and backend architecture to distribute operational ownership.
- **Recognised Contributor to Organisational Maturity -** Earned multiple monetary awards for contributions that strengthened release reliability, improved audit readiness, and advanced internal engineering governance.

CGI | Bangalore, Karnataka | 2017 - 2021

Role: Associate Software Engineer | July 2017 – October 2019
Role: Software Engineer | October 2019 – October 2021

IMPACT: Strengthened production reliability for mission-critical telecom applications by managing complex deployment cycles, triaging high-priority incidents, and ensuring uninterrupted customer-facing operations across multiple time zones. Established automation foundations that significantly reduced manual workloads, improved response times during outages, and brought audit-ready consistency to routine system checks. Enabled organization-wide adoption of intelligent automation by translating operational challenges into scalable engineering solutions, empowering cross-functional teams, and building reusable frameworks now leveraged across hundreds of applications.

- **Production Reliability for Enterprise-Scale Applications:** Maintained stability for 15 Java/WebLogic applications used by Bell Canada's call-centre ecosystem through daily sanity checks, infra monitoring, and continuous coordination with development, QA, network, and client teams.
- **High-Intensity Incident Resolution (P1/P2 Response) -** Handled 24×7 critical incidents within 1–3 hours by diagnosing root causes during bridge calls involving 20–30 stakeholders, restoring customer-impacting services without escalation.
- **Structured Deployment Cycles & Controlled Releases -** Executed 2–3 deployments per week across staging and production environments, performing dry runs, validating rollback plans, documenting procedures, and aligning all changes with application owners and change managers.
- **Data Validation & Ticket Resolution -** Resolved P3/P4 customer issues through targeted DB queries, root-cause checks, and authorised updates—supporting billing accuracy, feature activation, device provisioning, and channel availability across the Bell TV ecosystem.
- **Intelligent Automation Program (IAP – Cross-Org Initiative) -** Contributed to a 4-member core team building automation frameworks for 20+ teams and 500+ employees including software engineers, tech leads, directors, application owners, change managers, designing reusable Python modules for infra checks, DB validation, and UI health monitoring across diverse architectures.
- **End-to-End Automation Deployment Across 30 Applications -** Delivered requirement gathering, development, code reviews, dry runs, and production rollouts—deploying 110+ automation routines over 2.4 years for sanity checks, restarts, reporting, and reliability workflows.
- **Operational Time Reduction & Error Elimination -** Reduced manual sanity-check effort from 3–4 hours to under 30 minutes through automated reports, standardised workflows, and fault-tolerant restart sequences, strengthening recovery capabilities during network outages.
- **Knowledge Enablement & Team Upskilling -** Delivered workshops, walkthroughs, and hands-on onboarding sessions for 10+ teams; during notice period, trained junior engineers to operate the automation framework and helped them deploy 8+ new automations.
- **Service Quality & Governance Improvements -** Introduced documentation standards, deployment templates, and repeatable operational procedures that ensured consistency for production support teams and accelerated readiness for future automation initiatives.
- **Recognised Contributor -** Earned the **CGI APEX Gold Award (2020)** and the **Key Contributor Award (Q3 FY2020)** for exceptional work in automation delivery and high-stakes production support.

Phaneendra Reddy Dwaracharla +91-9493420691 | phani0526@gmail.com

Core Competencies

Backend Engineering | Django-Based Application Development | Release Engineering | Build Tracking & RCA Systems | High-Scale Production Operations | Workflow Automation | Data Integrity Validation | Cross-System Reconciliation | Secure API Development | Role-Based Access Control (RBAC) | Infrastructure Administration (Linux, Apache2, RHEL, Ubuntu) | Event-Driven Automation | Complex SQL Querying | DevOps Collaboration | Stakeholder Requirement Gathering | Operational Process Optimization | Audit-Ready Documentation & Knowledge Transfer

Technical Skills

Languages & Frameworks: Python, Django, Shell Scripting
Databases: MySQL (schema design, joins up to 6 tables, optimisation), SQL-based data validation
Version Control & Build Systems: Git, SVN, Jenkins
Web & Backend: Apache2, Gunicorn, SSL, SSO (SAML2), Role-Based Access Control
Operating Systems & Infrastructure: Ubuntu, RedHat (RHEL), Linux CLI, NFS, OS Patch Management
Monitoring & Tooling: Dynatrace, ELK, ITSM Tools, Jira
Automation Platforms: Ansible, Internal Intelligent Automation Program (IAP) Framework
Other Core Technical Areas: Event-based triggers, REST APIs, Documentation for ISO-27001 audits, Production deployment practices, Staging-to-Production release workflows

Educational Credentials

- **PG Diploma – Machine Learning & Artificial Intelligence** | Amity University | 2020
- **B.Tech – Electronics & Communication Engineering** | Sree Vidyanikethan Engineering College | 2017

Certifications

- **Microsoft Azure Fundamentals (AZ-900)**
- **Advanced Certification in Blockchain, Cloud & IoT**
